### Ignition Point Design Requirements - Be Capsule in Gas-Filled Hohlraum

Number	Rev	WBS	Component	Title	short req't	Requirement Text
1	0	I.4.1	Target	Requirements apply at shot temperature	Requirements apply at shot temperature	All requirements on targets shall apply at the temperature of the subject component at the time of the shot
2	0	I.4.1	Target	Tolerances are specified as hard limits	Tolerances are hard limits	Unless specifically stated otherwise, all requirements on targets shall be hard limits (as opposed to statistical values such as 1 sigma, 3 sigma, or RMS). If targets are produced that do not meet hard-limit requirements, they shall be dispositioned on a case-by-case basis by an MRB.
3	0	I.4.1.1	Capsule	Capsule outer radius, range of possible requested values and point-design value	900-1100 $\mu\text{m}$	Capsules shall be producable with outer radii within the range 900 - 1100 $\mu\text{m}$ . The outer radius of each capsule will be specified within this range. The point design value shall be 1.0 mm.
4	0	I.4.1.1	Capsule	Capsule outer radius, tolerance	$\pm 5\mu\text{m}$	The outer radius of the capsule shall be within $\pm 5\mu\text{m}$ of the specified value.
5	0	I.4.1.1	Capsule	Ablator – Low level impurities	$\text{sum}(\text{atomic fraction})^*Z^2 < 0.1$	Except for allowed ingredients as listed in the ablator composition entries, the ablator material in all layers shall contain sufficiently low impurity levels that the sum over all impurities of atom fraction * $Z^2$ shall be less than or equal to 0.20, i.e. 20%. For example, a barely allowed impurity set would be [C,Al,Si,Mn,Fe,Ni] with atomic fractions 0.01*[0.15,.007,.006,.0005,.021,.0031] giving Fe-dominated weighted sum $0.01*(.54+1.18+1.18+0.31+14.20+2.43)=0.20$
6	0	I.4.1.1	Capsule	Ablator – High level impurities with known acceptable presence		Ablators may contain specified materials as described in individual ablator composition requirements.
7	0	I.4.1.1	Capsule	Ablator – measurement of x-ray optical depth variations	accuracy <0.01%	Lateral variations in optical depth through the ablator shall be measured with accuracy better than 0.01%, at lateral scales between 120 and 3000 $\mu\text{m}$ (modes 2–25), at 5.4 keV x-ray energy. Entire capsule shall be measured down to 120 $\mu\text{m}$ lateral scale (mode 25). These measurements will constrain porosity, density variations, isolated defects, and variations in thickness of the internal layers. It will be very valuable to have scans of representative patches of representative capsules at lateral scans down to 20 $\mu\text{m}$ (mode 150).

If present, oxide layers internal to the ablator shall be small enough that the ablator satisfies the requirements on impurities and on optical depth when averaged over any 3 $\mu\text{m}$ layer. Requires an internal layer of BeO at density 3 g/cc to be thinner than 20 nm.

## Surface roughness and thickness power spectra for graded doped Be capsule - Rev 0

### Notes:

- First table is the 2D power in the low modes, in  $\text{nm}^2$ . Requirement for modes 1-12.
- Second table is the 1D power for each surface in a trace, in  $\text{nm}^2$ . Required for modes >12, included for information purposes for low modes
- Inner surface roughness is defined relative to an ideal sphere of the same average radius.  
Other surfaces are all defined relative to inner surfaces, i.e. they are actually the variation in the thickness
- Coding that generates trace powers is in surfaces093005.i
- Outer surface relative to inner surface
- At low modes, assumes inner surface and thickness are randomly phased.  
At high modes, assumes inner & outer surfaces randomly phased.
- Second dopant surface, relative to inside of Be shell
- Third dopant surface, relative to inside of Be shell
- Fourth dopant surface, relative to inside of Be

**Isolated surface defects - Rev 0**

Notes:

Horizontal axis: characteristic FWHM size of defect, in cm, either width if scratch/ridge or diameter if divot/bump

Upper curves: maximum depth of long defect (scratch or ridge) that has length  $\gg$  width.

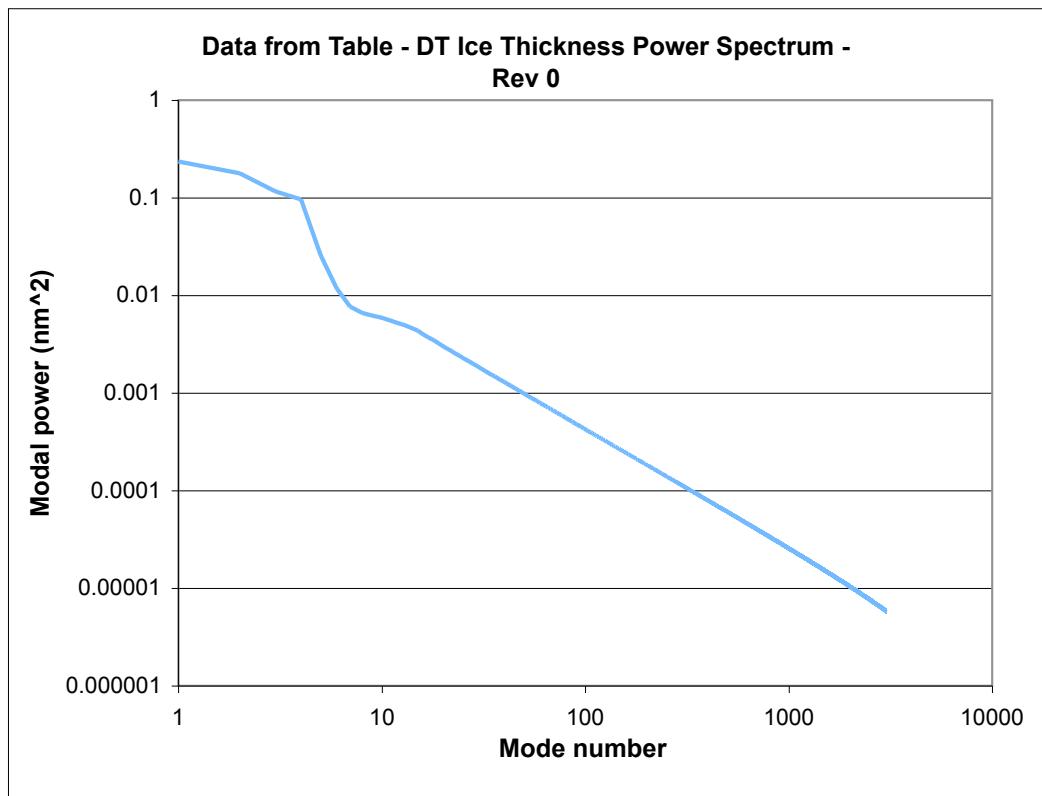

Horizontal axis in plot is FWHM.

Lower curves: maximum depth of defect that has length  $\sim$  width = horizontal axis (bump or divot) FWHM

Up to 20 defects allowed whose size is between the indicated limits and that limit divided by 3. Up to 100 defects allowed whose size is between the indicated limit/3 and limit/10. Defects smaller and/or more numerous than that are limited by surface roughness specification.

**Notes:**

1. Intensity contours are constant displacement d from reference ellipse d=0.
2. The a and b values are orthogonal displacements relative to beam center.
3. Spot scale 0.8 has been used in all Lasnex calculations of 1.0 MJ designs.
4. You can adjust spot scale (D1) or quad power (F24 and K24) to see effects.

CH1	0	I.4.1.1	CH Capsule	Applicability of other requirements		All requirements in table "Point Design Req'ts" except those designated for component "Layered Be capsule" shall apply to the CH capsule
CH2	0	I.4.1.1.4	CH Capsule	Ablator composition	see table	The ablator material shall be C:H:O 0.43:0.56:0.01. C:H ratio shall be within 10% of specified. O at% shall be less than 4%. Dopant Ge fraction shall be as specified in Table "Ablator layer requirements for CH Capsule - Rev 0." Atomic fraction x of Ge reduces C atomic fraction by x, leaving H and O fractions unchanged.
CH3	0	I.4.1.1.3	CH Capsule	Ablator total thickness - range of possible requested values	140-160 µm	Capsule ablator shall be producable with total ablator thickness within the range 140-160µm. The ablator thickness for each capsule will be specified within that range. Current design 146 µm.
CH4	0	I.4.1.1.3	CH Capsule	Ablator Dopant	Ge	The dopant material for all doped layers shall be Ge
CH5	0	I.4.1.1.3	CH Capsule	Ablator layer thicknesses	see table	The thickness of the layers within the ablator shall be as listed in Table "Ablator layer requirements for CH Capsule - Rev 0"
CH6	0	I.4.1.1.3	CH Capsule	Ablator layer dopant concentration	see table	The dopant concentration in each of the layers within the ablator shall be as listed in Table "Ablator layer requirements for CH Capsule - Rev 0"

Surface roughness and thickness power spectra for layered CH capsule - Rev 0

Notes:

- First table is 2D power, in nm<sup>2</sup>, applies to modes 1-12
- Second table is the 1D power for each surface in a trace, in nm<sup>2</sup>. Applies to modes >12, included for low modes for information only.
- Inner surface roughness is defined relative to an ideal sphere of the same average radius.  
Other surfaces are all defined relative to inner surfaces, i.e. they are actually the variation in the thickness
- Coding that generates trace powers is in Haan's file surfacesCH093005.i
- Outer surface relative to inner surface. Note does not apply at modes 20 and above.
- At low modes, assumes inner surface and thickness are randomly phased.  
At high modes, assumes inner & outer surfaces randomly phased.
- Second dopant surface, relative to inside of CH shell
- Third dopant surface, relative to inside of Ch shell

UB6	0	I.4.1.1.2.1	Be (uniform) capsule	Ablator inner surface figure	see table	The power spectrum of the deviation of the inner surface of the Be ablator from a perfect sphere of the same average radius shall not exceed the spectrum in Table "Surface roughness and thickness power spectra for uniformly doped Be capsule - Rev 0." "Shall not exceed" means that the 2D power in modes 1-12 shall be less than that tabulated, and the 1D power in a trace, summed over any +/- 15% bandwidth above mode 12 shall be less than that of the same bandwidth for the reference power spectra.
UB7	0	I.4.1.1.2.1	Be (uniform) capsule	Ablator thickness non-uniformity	see table	The power spectrum of the non-uniformity of the cumulative thickness of each layer shall not exceed the spectrum in Table "Surface roughness and thickness power spectra for uniformly doped Be capsule - Rev 0." "Shall not exceed" means that the 2D power in modes 1-12 shall be less than that tabulated, and the 1D power in a trace, summed over any +/- 15% bandwidth above mode 12 shall be less than that of the same bandwidth for the reference power spectra.

UB12	0	I.4.1.1.2.1	Be (uniform) capsule	Joint configuration	see figure, dimensions known to < +/-20%	The joint configuration shall be as shown in Figure "Uniform Be Capsule Joint Configuration - Rev 0". All dimensions shall be measured to an accuracy better than 20%

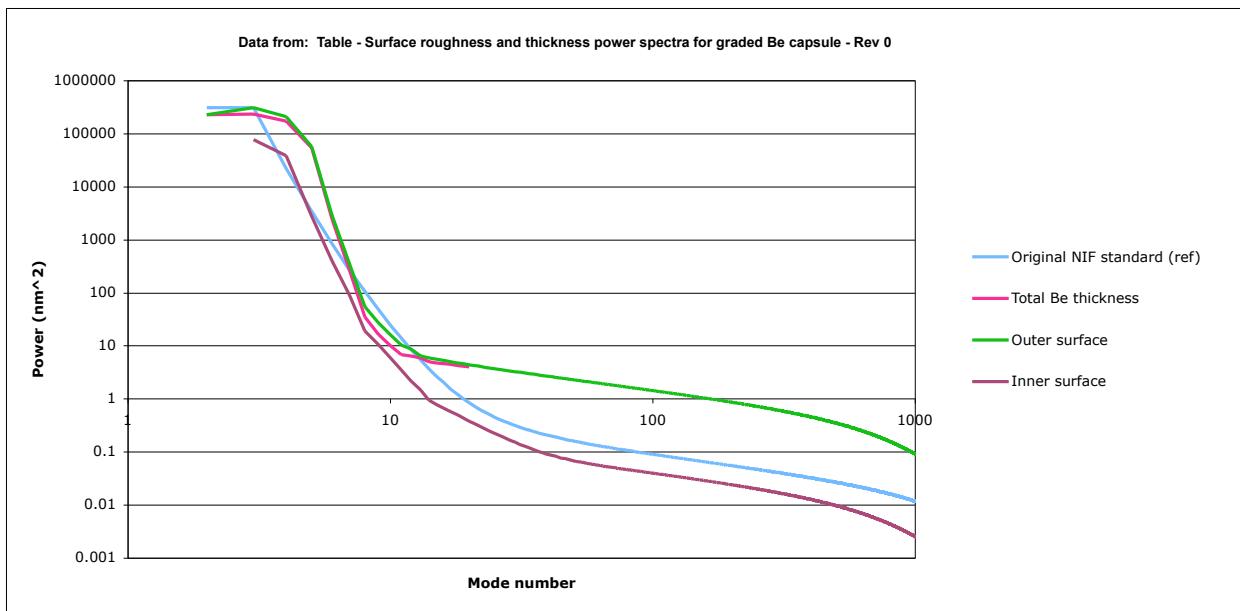

## Uniform Be Capsule Joint Configuration - Rev 0

Notes:

1. All dimensions in microns.
2. Assumed wall thickness of 150 microns. Dimensions would be scaled for different wall thickness.

Butt joint, surface finish on surfaces  
is 25 nm  $R_a$

### Surface roughness and thickness power spectra for uniformly doped Be capsule - Rev 0

#### Notes:

- First table is 2D power, applies to low modes
- Second table is the 1D power for each surface in a trace, in  $\text{nm}^2$ . Applies to modes >12, included for low modes for information only.
- Inner surface roughness is defined relative to an ideal sphere of the same average radius.  
Other surfaces are all defined relative to inner surfaces, i.e. they are actually the variation in the thickness
- Outer surface relative to inner surface, for modes 1-19
- At low modes, assumes inner surface and thickness are randomly phased.
- We have specified the outer and inner surfaces to have a factor of two lower power at all modes compared to the graded dopant capsule. Depending upon the specific choice of dopant concentration, perturbation growth at low, intermediate, or high modes can be either higher or lower than the graded dopant capsule, but not uniformly lower.

mode number	Original NIF standard, reference, $\text{nm}^2$	Inner surface (radius), $\text{nm}^2$	Total shell thickness, $\text{nm}^2$ (note 4)	Outer surface, $\text{nm}^2$ (note 5)
